

Full stack developers exercise

Specifications:

- Provide a one-page whether site that will show the whether for 3 main cities (you can choose your default) and will provide a search section that will provide the weather for a chosen city.

- To get the whether data you can use <https://www.apixu.com> API or other free whether API service.
- Technologies to use:
 - Server – PHP /Node JS
 - Client – Angular / React
 - Feel free to add other technologies that can help you.
- Bonus points:
 - Add a login area, and for a logged in user show his last 3 searched cities instead of the 3 default ones.
 - Pick a DB (MySQL, MongoDB) and use it to save the selected whether per user.
 - Change the UI and provide a more complex one.
